The app uses the REST based MS SQL Database using a Data Service and a Service Reference. I am having trouble adding the connection string to the config.json file. I have tried: Adding the connection string in appsettings.json (with no luck). Adding the connection string in app.config (with no luck). Adding the connection string in my Web.config (with no luck). I can add the connection string to my Web.config file in the corresponding MVC project if I am trying to add the connection string from my MVC project. Any help would be appreciated. A: Turns out I was missing the ServiceReferences.cs file which had the following class: public class ServiceReferences : ServiceReferencesBase { public ServiceReferences() : base(default(string), "DataService.svc", "") { } } My solution specific config file (in my case app.config) had an incorrect connection string. I had the following: Replaced with the following and it worked: Kamis, 26 Januari 2014 Interview with K. Ashley Smith PhD Ph.D. candidate in the School of Library and Information Studies at the University of Michigan. I'm an information scientist who uses information science to study information, in particular how people make sense of, access, and use information. I was drawn to the writing school because it combines an emphasis

БЕСКАТОРИЯ - соглашение с корпоративными общественными организациями будет проведено в отношении корпоративной речи. 1. Field of the Invention This invention relates generally to a system and method for wind actuated synchronizing device and more particularly to a system and method for controlling a wind actuated synchronizing device. 2. Description of the Background Art Some conventional synchronization devices use wind energy to synchronize the timing of a main drive train with a secondary drive train that drives an output shaft. If both drive trains are synchronized, the output shaft rotates at twice the speed of the input shafts. The secondary shaft is coupled to the output shaft by a clutch. The clutch is disengaged until the secondary drive train is synchronized, at which time the clutch is engaged. Conventional wind actuated synchronization devices use a spring and a rope to synchronize the speed of the secondary drive train. The clock spring pulls a rope as a function of an external wind force to synchronize the secondary drive train with the main drive train. These conventional wind-actuated synchronization devices have several drawbacks. The spring and rope combination is only effective if the secondary train is substantially free-running. In high-speed, high-torque applications, the secondary drive train is often not free-running. In this case, the spring and rope combination can be ineffective. In addition, the spring and rope combination can wear out quickly. In particular, if the rope wears, the spring has a limited lifespan. Therefore, there is a need for a synchronization device that is more effective and more durable than conventional wind-actuated synchronization devices. In addition, there is a need for a wind-actuated synchronization device that can be used in high-speed, high-torque applications. During the last decade, the definition of the maturation of the male germline has received a major boost, as the signaling pathways of the DNA damage response have been identified and used for f30f4ceada
