Q: Custom LinkedList (Doubts about implementation) I have been experimenting with LinkedList for some time and I am trying to create a custom implementation, but I don't know the exact purpose of each and every part. For example I don't know why should I use different methods to create a new node and get to the first/last node.

```
class LinkedList implements ListInterface {  
    /** * Index of a Linked List. */ private int index; /** *  
    Checks if LinkedList is empty. */ public boolean isEmpty() { return (index == -1);  
} /** * Index of last node. */ public int getIndex() { return index; } /** * *  
    @param index * @return Node at that index. */ public Node get(int index) { if  
(index = size()) { throw new IndexOutOfBoundsException(); } Node current =  
null; Node previous = null; Node n = head; while (n!= null && index > 0) {  
current = n; n = n.getNext(); 1d6a3396d6
