Q: How to handle the "child has released all its references but one" case I have a web application that allow users to make use of some objects such as different widgets (JQSlider/JQInput/JQDatepicker). When the user clicks on a button it's supposed to destroy all the objects but one, keeping the number of references to the "parent" object at two (the button and the widget itself). Let's say the widget is a JQSlider, it has the following public methods: public void setModel(JQSliderModel model); public void setValue(int value); public void setValue(float value); These methods all do their thing and call the right setter of the model to set the value of the slider. The parent class is a class that make calls to the setters of the different widgets, and does not hold any reference to them, but that's not important for this question. To destroy the widget (I can't call dispose since that does nothing), I
