It may be that you didn't really "save" the file, but it's good to know that it's still on the disk in case you run out of RAM, or if the system crashes, etc. The "save" is in the "redundant storage" sense - the file is still in the disk even though it's copied to the RAM. In the context of databases, the "save" is "to backup" the database to some other location (in the event of a complete system failure, disaster, etc). A: In
