CHAPTER 7 Workflow The workflow model is a set of processes that are part of a series of events or activities that are needed to complete a particular task or product. It is a process management technique that emphasizes the separation of people and technology (Figure 7.1). The basic workflow stages include the following: (1) identifying and analyzing the needs of the customer, (2) gathering the information needed to design and build the product, (3) designing and building the product, (4) creating documentation and marketing, and (5) selling the product. When implemented properly, the workflow process allows a project to be completed with little or no supervision.

FIGURE 7.1 Workflow is an effective way to organize a project to complete it in an efficient manner. Each phase in the workflow model is a critical success factor (CSF) of the product design. A CSF is a characteristic of a product or process that makes it more likely to be successful. For example, it may be more likely that a person will complete a project if she is given adequate time and information. The workflow can be used to manage all phases of the product design and production process, not just the product design. Most design firms and other business-related enterprises have the appropriate information and technology for a project to be completed. The design firm will typically begin the project by identifying the customer's needs. After the initial needs have been defined, the design firm will gather as much information as possible to satisfy the needs. Once the project has been designed, the design firm will assemble the various products and deliver the products to the customer

What's New In AutoCAD?

Markup directly in your drawings: Add handwritten annotations to any drawing and they'll appear in all views. The software understands handwriting and can read a single stroke from multiple angles, so you don't have to be a calligrapher to do this. (video: 2:34 min.)

Markup with the Markup Tool: Take a stab at the creative process. You can draw or write a text note, check a box, draw a rectangle, and save it. If you are too busy to do this, you can use the AutoCAD Markup tool to check boxes, rectangles and text notes (video: 1:39 min.)

3D Modeling: When you are in a modeling environment, you need to be able to view, navigate and edit the models in 3D. AutoCAD makes these tasks easier for you with a number of new features.

3D Extents can be used to navigate the 3D model. Extents are 2D coordinates that act as a reference point within the model. Each type of extents has specific uses depending on the task you want to perform. for example, to navigate the entire drawing: Select the Active3D Object Extents on the Home tab of the ribbon. for example, to see if the 3D view is over a feature in the drawing: Use the 3D View/3D Measure tool to set the measurement units to the Linear unit. This will set the distance in the Active3D Extents to the distance in the model. 3D Extents can be combined to navigate over and around an object. If you have more than one 3D Extents, click and drag to navigate a 3D Extents around an object.

Ribbon Panels: With ribbon panels, you have the flexibility to display a lot of information in your drawings. Ribbon panels now display commands, and if you select the properties tab on one, you can see the properties of the command as well. The ribbon panels also have "groups", which are collections of ribbon panels. Groups can be created by dragging and dropping them together, or by creating them from existing ribbon panels. Now when you add a ribbon panel, you can choose where to put it, and it will appear on the bottom of the ribbon panel instead of the top. This is a big improvement in usability, but
